

Week 1

5 interesting concepts learnt from the lecture

- Research of Joseph Redmon on Computer Vision
- Augmentation
- Edges and Features
- Image preprocessing
- Image coordinating
-

Types of medical Reports and medical imaging

- **Lab reports** — present test results from blood/fluid samples against a reference range, flagging anything outside normal
- **Pathology reports** — describe tissue samples examined under a microscope, common after biopsies or tumor removals
- **Discharge summaries** — recap a hospital stay from admission to discharge, including reason for hospitalization, key findings, treatment course, and discharge medications
- **Surgical/operative notes** — document what was done during a procedure and any complications

Medical imaging reports

These are written by a radiologist after reviewing scans like X-ray, CT, MRI, or ultrasound. A typical report follows a structure: indication (why the scan was ordered), technique (how it was performed), comparison (to prior imaging), findings, and impression.

The two sections that matter most:

- **Findings** — detailed, technical observations of everything visible in the imaging study
- **Impression** — a concise summary distilling the findings into the radiologist's actual diagnosis or interpretation; most referring physicians focus mainly on this section since the findings can be dense and technical
